TECHNOLOGY STACK TEMPLATE:

The **technology stack** refers to the set of technologies, programming languages, frameworks, and tools used to develop and run the system. For the project **"Streamlining Ticket Assignment for Efficient Support Operations"**, the following technologies are used.

1. Frontend Technologies

The frontend is responsible for the **user interface and interaction** with the system.

Technology	Purpose
HTML	Used to create the structure of web pages
CSS	Used to design and style the user interface
JavaScript	Used to add interactivity and dynamic behavior

Description:

Frontend technologies help users such as customers, support agents, and administrators interact with the system through forms, dashboards, and ticket submission pages.

2. Backend Technologies

The backend handles the **business logic and system functionality**.

Technology	Purpose
PHP	Processes user requests and manages system logic
Node.js/Python (optional)	Handles server-side processing

Description:

The backend processes ticket requests, assigns tickets to support agents, and communicates with the database to retrieve or store data.

3. Database

The database stores all the **system data and records**.

Technology	Purpose
MySQL	Stores ticket information, user details, and agent data

Description:

The database ensures that ticket details, user accounts, and support agent information are securely stored and easily accessible.

4. Development Tools

These tools help developers **build, test, and manage the system**.

Tool	Purpose
Visual Studio Code	Code editing and development
Git	Version control and collaboration
XAMPP	Local server environment

5. Platform

Platform	Purpose
Web Application	Allows users to access the system through a web browser
